The current tests are generally complementary; scintigraphy is typically the first test in the evaluation of gastric motor function and often confirms the clinical suspicion of dysmotility. Manometry identifies patterns suggestive of myopathy, neuropathy, or obstruction but may be most helpful when it shows entirely normal findings, because manometry helps in part to exclude dysmotility as a cause of symptoms.

Measurement of gastrointestinal motility in the GI laboratory

Several tests are available in the GI Manometry Lab to help diagnose motility (movement) disorders of the esophagus and their complications. These tests include: Esophageal manometry, which uses specialized pressure sensing catheters that can evaluate disorders of the motor function of the esophagus and its sphincter muscles. This test can diagnose disorders of weak or uncoordinated muscle function, including such conditions as achalasia, diffuse esophageal spasm, ineffective esophageal ...
