It illuminates the major transformations that contributed key adaptations to the body: the rise of bipedalism; the shift to a non-fruit-based diet; the advent of hunting and gathering, leading to our superlative endurance athleticism; the development of a very large brain; and the incipience of cultural proficiencies. In this landmark book of popular science, Daniel E. Lieberman—chair of the department of human evolutionary biology at Harvard University and a leader in the field—gives us a lucid and engaging account of how the human body evolved over millions of years, even as it shows how the increasing disparity between the jumble of adaptations in our Stone Age bodies and advancements in the modern world is occasioning this paradox:

Story of the Human Body explores how the way we use our bodies is all wrong. From an evolutionary perspective, if normal is defined as what most people have done for millions of years, then it's normal to walk and run 9 -15 kilometers a day to hunt and gather fresh food which is high in fibre, low in sugar, and barely processed. It's also normal to spend much of

Never have we been so healthy and long-lived - but never, too, have we been so prone to a slew of problems that were, until recently, rare or unknown, from asthma, to diabetes, to - scariest of all - overpopulation. Story of the Human Body asks how our bodies got to be the way they are, and considers how that evolutionary history - both ancient and recent - can help us evaluate how we

He draws on the explosion of discoveries made over the past 20 years to demystify the fascinating cast of characters who hold the secret to our origins, and describes the main sites, individual fossils, key scientific breakthroughs, and latest research that have fed our knowledge. With the help of a rich assortment of photographs,

Davis's account is swift and clear, never dull or dry. He lightens it with pungent anecdotes and witty quotes. Although this compact volume may not be hard to pick up, it's definitely hard to put down. For example, on the death of Alexander the Great, who in a decade had never lost a single battle, and who had staked out an empire that spanned the entire Near East and Egypt, Davis writes: "When they heard how ill he was, the king's devoted troops insisted on seeing him. He

couldn't speak, but as his soldiers -- every one -- filed by in silence, Alexander's eyes uttered his farewells. He died in June 323 B.C., at the ripe old age of thirty-two." In similar fashion Davis recounts Russia's triumph in the space race as it happened on an autumn night in 1957: "A bugle sounded, flames erupted, and with a roar like rolling thunder, Russia's rocket lifted off. It bore aloft the earth's first artificial satellite, a shiny sphere the size of a basketball. Its name was Sputnik, meaning 'companion' or 'fellow traveler' (through space). The

watchers shouted, 'Off.

She's off. Our baby's off!'

Some danced; others kissed
and waved their arms."

Though we live in an age of
many doubts, James C. Davis
thinks we humans are
advancing. As The Human
Story ends, he concludes,
"The world's still cruel;
that's understood, / But
once was worse. So far so
good."

of ourselves as exceptional beings, but is there really anything special about us that sets us apart from other animals? Humans are the slightest of twigs on a single family tree that encompasses four billion years, a lot of twists and turns, and a billion species. All of those organisms are rooted in a single origin, with a common code that underwrites our existence. This paradox - that our biology is indistinct from all life, yet we consider ourselves to be special - lies at the heart of who we are. In this original and entertaining tour of life on Earth, Adam

It's time for a story of human evolution that goes beyond describing "ape-men" and talks about what women and children were doing. In a few decades, a torrent of new evidence and ideas about human evolution has allowed scientists to piece together a more detailed understanding of what went on thousands and even millions of years ago. Problems our ancestors faced, the solutions they found, and the trade-offs they made. The drama of their experiences led to the humans we are today: an animal that relies on a complex culture. We are a species that can and does rapidly evolve cultural solutions as we face new problems, but the intricacies of our cultures mean that this often creates new challenges. Our species' unique capacity for culture began to evolve millions of years ago, but it only really took off in the last few hundred thousand years. This capacity allowed our ancestors to survive and

raise their difficult children during times of extreme climate chaos. Understanding how this has evolved can help us understand the cultural change and diversity that we experience today. Lesley Newson and Peter Richerson, a husband-and-wife team based at the University of California, Davis, began their careers with training in biology. The two have spent years together and individually researching and collaborating with scholars from a wide range of disciplines to produce a deep history of humankind. In *A Story of Us*, they present this rich narrative

and explain how the evolution of our genes relates to the evolution of our cultures. Newson and Richerson take readers through seven stages of human evolution, beginning seven million years ago with the apes that were the ancestors of humans and today's chimps and bonobos. The story ends in the present day and offers a glimpse into the future.

No doubt, history is littered with theories and beliefs that not only proved to be wrong in the end, but also costly as far as the human search for truth and development is concerned.

The view that the Earth was the physical and the biological center of the Universe was one such failed theory, one that cost many famous scientists most of their lives, and held back societies everywhere for decades or hundreds of years behind what is now considered a given truth. In the current work under consideration, religion and evolution theories come under scrutiny in light of recent scientific facts that dispute their most important claims about the origins of the species.
