In all ultrasound-guided paravertebral block techniques, an indication of correct needle tip placement is the anterior displacement of the parietal pleura when the solution of local anaesthetic is being injected. Hydrolocation with saline can be used to help with needle tip position; this is particularly useful when the anatomy on

Given the fast development and increasing clinical relevance of ultrasound guidance for thoracic paravertebral blockade, this review article strives (1) to provide comprehensive information on thoracic paravertebral space anatomy, tailored to the needs of a regional anesthesia practitioner, (2) to interpret ultrasound images of the thoracic paravertebral space using cross-sectional anatomical images that are matched in location and plane, and (3) to briefly describe and discuss different ...

It can be performed at the Cervical, Thoracic or Lumbar level; however only the Thoracic Paravertebral block will be discussed here. Thoracic paravertebral block confers several advantages over epidural block: Comparable pain relief with reduced side effects. Better pulmonary function and fewer pulmonary complications; Contraindications to thoracic epidural block do not preclude thoracic paravertebral block e.g. systemic sepsis, deranged coagulation; Indications

With the use of ultrasonography in peripheral nerve blocks, paravertebral block can now be performed by direct observation through ultrasound. Ultrasound-guided paravertebral block practices have been reported in children (1, 2). We aimed to share our first experience in ultrasound-guided paravertebral block application.

Recently, there has been remarkable changes in the concept of thoracic paravertebral block (TPVB), and several indirect TPVB approaches have been described 1; erector spinae plane block (ESPB) is a representative indirect TPVB method, reported by Forero et al 2 in 2016. Most indirect TPVBs, including ESPB, are interfascial plane blocks.
