Flibe Energy is pursuing a design called a liquid-fluoride thorium reactor (LFTR), which is a modern variant of the work initiated at Oak Ridge during their research into molten-salt reactors. Other companies have also formed since 2011 to pursue molten-salt reactors, but their designs have not incorporated the thorium fuel cycle, relying instead on enriched uranium.

~~LFTR Overview — Energy From Thorium~~

The liquid fluoride thorium reactor (LFTR; often pronounced lifter) is a type of molten salt reactor. LFTRs use the thorium fuel cycle with a fluoride -based, molten, liquid salt for fuel. In a typical design, the liquid is pumped between a critical core and an external heat exchanger where the heat is transferred to a nonradioactive secondary salt.

~~Liquid fluoride thorium reactor — Wikipedia~~

A LFTR is a Lithium Fluoride Thorium Reactor, which is a breeder type Molten Salt Reactor. (MSR) MSRs are nuclear power reactors which use a molten salt, not unlike table salt, to carry heat, and in most designs, the nuclear fuel itself.

~~What is a LFTR? | Techiety~~

LFTR stands for liquid thorium fluoride reactor and is pronounced “lifter.” This type of nuclear power is generated from Thorium. Thorium is nearly as abundant as lead in the earth’s crust, making it a very common metal. LFTR reactors use thorium dissolved into liquid form coupled with salts as a fuel source.

A Molten Salt Reactor, such as Liquid Fluoride Thorium Reactor (LFTR, pronounced “lifter”) produces energy using a liquid (molten) nuclear fuel, not a solid fuel. MSRs also use a coolant that remains liquid at atmospheric pressure.

A Liquid Fluoride Thorium Reactor (LFTR) is a type of Molten Salt Reactor (MSR) that can use inexpensive Thorium for fuel (thorium becomes uranium inside the reactor). A slightly different type of MSR can consume the uranium/plutonium waste from solid-fueled reactors as fuel.

~~LFTR — Liquid Fluoride Thorium Reactor~~

Reactors containing molten thorium salt, called liquid fluoride thorium reactors (LFTR), would tap the thorium fuel cycle. Private companies from Japan, Russia, Australia and the United States, and the Chinese government, have expressed interest in developing this technology.

These arguments are in reference to solid-fuel thorium reactors, when the design being most discussed for the past decade is a liquid-fueled thorium reactor (LFTR). The latter is greatly superior regarding resistance to weaponization. There are two options with conventional solid-uranium fueled LWR waste: store or re-process.
